

NINA SEMKINA

Senior Android Engineer | Kotlin · Jetpack Compose · Production Stability & Performance

Thailand (UTC+7) · nina.s.semkina@gmail.com · [LinkedIn](#) · [GitHub](#)

Open to relocation · Remote, hybrid or on-site

SUMMARY

Senior Android engineer with 14 years of production experience and a specialisation in application stability and performance at scale. Sustained 99.9% crash-free and 0.1% ANR on fintech products serving 20M+ active users, and turned around a consumer wallet from 93% to 99% crash-free in five months, lifting its store rating from 3.9 to 4.4. Led platform-level migrations (Java to Kotlin, MVP to MVI, XML to Jetpack Compose) across five engineering teams, and built AI-assisted development workflows delivering up to 70% faster turnaround on routine engineering work.

TECHNICAL SKILLS

Languages: Kotlin, Java, C++

Android & UI: Jetpack Compose, Coroutines, Flow, RxJava, WorkManager, Navigation, Paging, Retrofit, OkHttp, Hilt, Dagger 2

Data & Persistence: Room, SQLite, DataStore

Architecture: Clean Architecture, MVI, MVVM, multi-module architecture, Server-Driven UI, SOLID, design patterns

Stability & Performance: Firebase Crashlytics, Sentry, AppMetrica, Perfetto, Android Studio Profiler, LeakCanary, Firebase Performance, Baseline Profiles, Macrobenchmark, R8 / ProGuard

Testing & Quality: JUnit, Mockk, Turbine, Espresso, screenshot testing, Detekt, Spotless, ktlint

CI/CD & Tooling: GitLab CI, GitHub Actions, Gradle convention plugins, version catalogs, remote build cache, trunk-based development, feature flags

AI-Assisted Development: GitHub Copilot, Cursor, Claude Code, JetBrains AI: code generation, automated review, test generation, crash triage automation

PROFESSIONAL EXPERIENCE

B2Broker | Senior Android Engineer

Oct 2024 – Present

Global liquidity and technology provider for brokers and crypto exchanges. White-label trading application delivered as a SaaS bundle to 42 vendor brands, supporting MT4, MT5 and cTrader. 105 modules, 50+ core screens, 300K+ users across web and mobile.

- Sustains 99.9% crash-free and 0.1% ANR across all 42 vendor builds as the sole Android engineer owning the entire product surface
- Architected a runtime localisation library covering 5,000 keys, enabling any vendor to add or override languages with zero app releases; adopted by all three product teams and still in production two years on
- Cut CI cold release build time by 20%, from 25 to 20 minutes, through remote build cache tuning and task graph optimisation
- Automated new vendor onboarding to a 30-minute flavor setup, scaling the platform to 42 flavors and 3 build types without linear engineering cost
- Shipped loyalty program features in Kotlin, Clean Architecture and MVI, increasing engaged users by 30% after mobile rollout
- Led AI tooling adoption across coding, review and crash triage, and authored the company's comparative evaluation of GPT, Claude and Gemini, achieving up to 70% faster delivery on routine workloads and 30% on research-heavy tasks
- Raised unit test coverage to 41% and mandated screenshot coverage for every screen and UI component in the design system

Tinkoff (Koshelek) | Android Lead

Jul 2023 – Aug 2024

Koshelek, the consumer digital wallet for loyalty and bank cards acquired by Tinkoff in 2021; 10M+ downloads on Google Play, 219 modules, ~120 screens, 10 Android and 9 iOS engineers across 3 product teams.

- Raised crash-free rate from 93% to 99% and halved ANR from 0.4% to 0.2% in five months, lifting the store rating from 3.9 to 4.4
- Scaled the Android team from 3 to 10 engineers in four months across 25 interviews; appointed and managed three team leads while retaining architecture ownership, and rebuilt onboarding to a single sprint
- Rebuilt product analytics end to end: audited 420 events, eliminated 30% duplicates, and delivered a single-source-of-truth module feeding four destinations, cutting new event integration from days to under an hour for a cross-functional team of analysts, product managers, engineers and QA
- Cut average merge request review time from two days to four hours through automated checks (ktlint, AI-assisted review) and daily review commitments, removing a standing source of team friction
- Maintained trunk-based development with feature flags, guaranteeing hotfix delivery within one day of incident detection
- Restructured an over-fragmented module graph, shortening build times and eliminating duplicated components across teams
- Designed a navigation abstraction letting Fragment and Compose routes coexist behind one interface, driving XML screens down to 5% of the application

- Increased unit test coverage by 25 percentage points through a standardised test format and AI-assisted generation

Yandex.Money (YooMoney) | Android Engineer → Lead, Profile & Core teams

Aug 2018 – Jul 2023

Flagship B2C application of Russia's largest payment service, rebranded from Yandex.Money to YooMoney in 2020; 20M+ active users, 85 modules, ~140 screens, 4.7 store rating, 16 Android engineers across 5 teams.

- Sustained 99.9% crash-free and 0.1% ANR for five years on the Core team, tracked against an internal target on a shared application health dashboard
- Led the migration from MVP to MVI across all five Android teams; absorbed a 20% short-term velocity dip and delivered sustained above-baseline throughput, with recruitment reporting the modernised stack as a hiring advantage
- Drove the full migration of 140 screens to Jetpack Compose, personally converting 40 and rewriting the shared UI library that unblocked every product team
- Cut application size by 46%, from 280 MB to 150 MB, unlocking self-hosted distribution and in-app updates
- Diagnosed and resolved a production double-charge incident on account transfers within five hours, isolating the fault to legacy mutable state from behavioural symptoms alone
- Led the Profile team (12 engineers), then the Core team (7 engineers, 3 direct reports) serving 4 product teams; delivered the coroutines migration, unit test standards, and automated code generation of API models from specification
- Built an internal SSL pinning library validating full certificate chains against custom corporate root authorities, adopted by both mobile applications, and led the SDUI engine migration from Java to Kotlin, powering all utility payments and marketing surfaces
- Conducted 35 technical interviews resulting in 10 hires, mentored 10 engineers, and designed a structured promotion track for engineers preparing for the next grade

ONDOC | Android Engineer

Aug 2016 – Aug 2018

Digital health platform: patient-facing telemedicine and electronic medical record application aggregating data from 30 clinic networks; 500K+ users.

- Built WebRTC-based video consultations enabling remote doctor appointments across the partner network
- Built the medication module with prescription schedules and push notification reminders
- Integrated 10 partner clinic APIs across heterogeneous infrastructures; promoted to Senior within a year and took over as lead Android engineer

Author24 | Android Engineer

Jun 2015 – Aug 2016

B2C freelance services marketplace; sole Android engineer, ~40 screens, 4.5 store rating, 400K+ users.

- Owned the entire Android product end to end, rebuilding an inherited legacy codebase across 40 screens
- Built the full order lifecycle including a multi-state dispute resolution flow, in-app chat, and payment processing

Earlier Experience

2012 – 2015

CSBI Group, Java Developer (2014 – 2015): public transport tracking applications for Moscow and Saint Petersburg. Rhonda Ltd, Android / Java Developer (2012 – 2014): first Android product, an on-device computer vision camera configuration application shipped commercially with hardware.

EDUCATION

MSc, Applied Mathematics & Computer Science, Far Eastern Federal University, 2011

Specialisation in error-correcting coding; implemented a Reed-Solomon encoder and Sudan decoder in C++.

LANGUAGES

English — B2 Russian — Native

COMMUNITY & SPEAKING

- Podlodka Droid Crew, Program Committee Member & Host (2024 – Present): Android developer conference with 300 to 1,000 attendees per season. Shapes season themes, selects and coaches 14 to 17 speakers, and hosts 4 to 6 sessions per season as lead curator or co-host.
- Talks: "[Code That Works, But Poorly](#)" and "[Writing an App's Network Layer in 20 Seconds](#)" (recorded); "[Improving Code with a Functional Approach](#)" (Android Broadcast channel).
- Open source: [GloomMaster](#), an offline-first board game companion app demonstrating Macrobenchmark-based performance testing.
